

## Notes for Macintosh OS 10.4.x and iBurst Modem (PCMCIA)

10 August 2005

### Known issues:

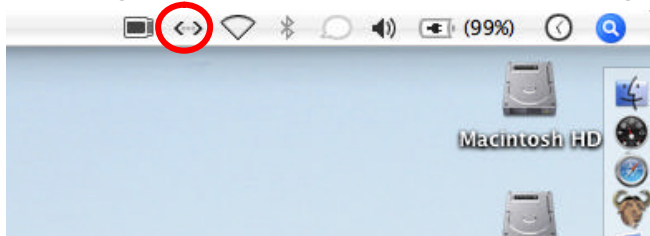

**Removing iBurst Modem (PCMCIA Card) while the PPPoE session is active is not recommended.**

When one removes iBurst Modem (PCMCIA Card) while the PPPoE session is active, OS and PC will hang up due to the characteristics with the OS ver.10.4.x. Kyocera is working with Apple Computer Inc. to resolve this issue.

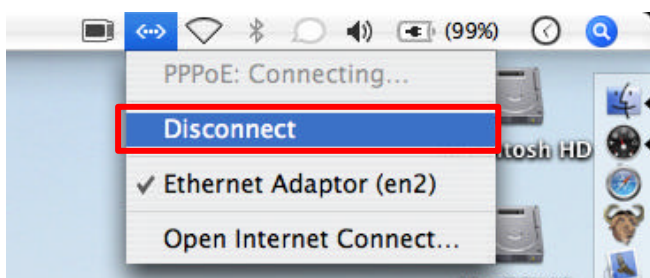

The following operations should be performed before removing iBurst Modem (PCMCIA Card), otherwise OS and PC hang up issue will occur:

“No Connect” operations:

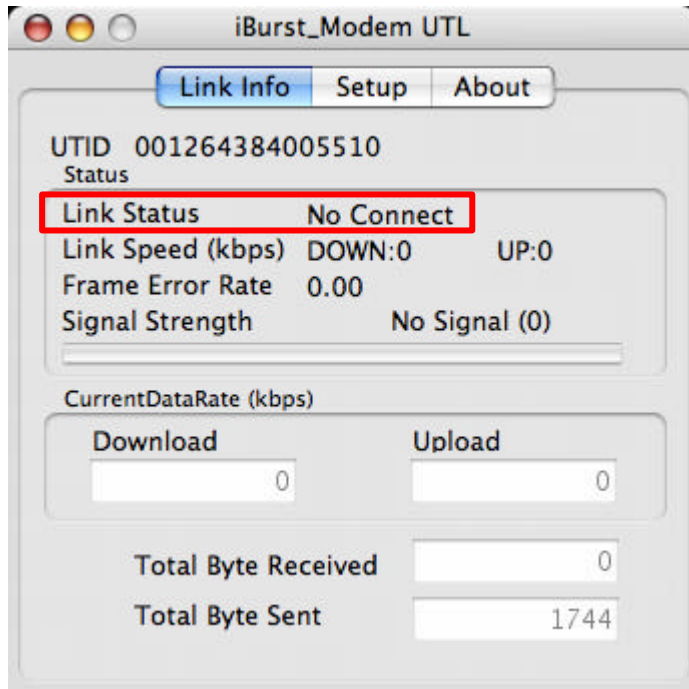

1. Using Menu of connection for PPP (upper right-side window menu).

2. Select “Disconnect”.

3. The status changes to “No Connect” automatically (iBurst\_ModemUTL window). The card may now be removed.

**Release software and version:**

Installer	iUtc_v120_050725.sit	v.1.20
Driver	iBurst.kext	v.1.0.4
Utility	iBurst_Modem UTL.app	v.1.07

\* Driver software and Utility software are included in the installer.

**Supported User Terminal type:**

iBurst Modem (PCMCIA Card)

**Supported OS:**

Mac OS X 10.4.x

Note: When installing above iBurst Modem (PCMCIA Card) Driver software, please ensure Macintosh OS X has been upgraded to 10.4.x. With Mac OS X versions of OS prior to 10.4.x, the alert “You can’t install software as OS is old” is displayed and installation of the software cannot proceed.
